Refrigerated Delivery Fleet — Lease-vs-Buy Decision Inputs

Decision context

Management is evaluating whether to replace the refrigerated delivery fleet by entering a new equipment lease or by purchasing the vehicles outright with financing. This package provides the inputs for a net-present-value comparison; the conventions below are to be used in the analysis.

Analysis horizon	7 years (expected service life of refrigerated vehicles)
Discount rate	Use 6.8% per annum (fleet incremental borrowing rate per the discount-rate memorandum)
Vehicles in scope	Four refrigerated delivery vehicles (two box trucks, two vans)
Decision basis	Lower present value of total cost, plus the qualitative factors noted below

Vendor quote — purchase path

Item	Box truck (×2)	Van (×2)	Notes
Purchase price (each)	\$148,000	\$84,000	Refrigerated, delivered
Estimated salvage (yr 7)	\$18,000	\$9,000	Residual value
Annual maintenance (each)	\$9,500	\$5,200	Rises ~5%/yr
Financing	6.8% / 60 mo	6.8% / 60 mo	Secured note

Lease path — term sheet

Item	Box truck (×2)	Van (×2)	Notes
Monthly lease (each)	\$2,650	\$1,520	Operating lease, full-service
Term	60 months	60 months	
Maintenance	Included	Included	Lessor-provided
End of term	Return	Return	No purchase obligation

Qualitative factors for the operations manager's consideration: fleet flexibility and refresh cadence, exposure to residual-value risk, maintenance burden, and balance-sheet effect. The recommendation should weigh the present-value comparison against these factors; thresholds, not labels, govern the conclusion.

All figures are decision inputs for the analysis and do not affect the recorded books.
